

Matthew Melio

Final Project: Deliverable 4

To deploy my restAPI on Heroku, I first had to download git to my computer through terminal. Once this was complete, I used the `$brew tap heroku/brew && brew install heroku` to install Heroku. Before actually uploading my code, I had to create a json file called package and input certain parameters. I also had to create a new variable to input a new port so that it was no longer a local host.

Once all this was done, I went to Heroku, signed up, and connected my code through my GitHub repository and officially created the app. Sadly, I could not get my code to compile correctly even after numerous attempts. The deployment was unsuccessful but I followed all the necessary steps to attempt to deploy. This was a very difficult task to accomplish, but I did the best I could with the resources given to me.
